

Specification Amendments

Please amend lines 10-11, page 13, of the Specification as follows:

The hub 5, in this case, is fixed nonreleasably to the wheel carrier & 7 via the flange rim 5b.

Please amend line 20, page 14, of the Specification as follows:

Figure 2a shows the shape deviations of the outer ring 2 as an individual component in comparison with the internal geometry 2r of the hole 7a. On account of its thin wall after cold forming or after curing, the outer ring 2 has a finished external geometry 2r, the diameter D_A of which is initially greater by the excess dimension $2 \times U$ than the internal diameter D_I of the hole 7a. In addition, the external geometry 2s deviates by the amount $2 \times V$ from the internal geometry 2r of the hole ~~7b~~ 7a.
